

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

Claim 1 (original): A parallel batch reactor for effecting chemical reactions, the parallel batch reactor comprising:

- a pressure chamber;
- an inlet port in fluid communication with the pressure chamber for pressurizing the pressure chamber from an external pressure source; and
- a plurality of reaction wells, each of said plurality of reaction wells being in isolatable fluid communication with the pressure chamber such that during a first pressurizing stage of operation, each of said plurality of reaction wells can be simultaneously pressurized through common fluid communication with the pressure chamber, and such that during a second reaction stage of operation, each of said plurality of reaction wells can be fluidically isolated from at least one other of said plurality of reaction wells.

Claim 2 (original): The parallel batch reactor of claim 1 wherein said plurality of reaction wells comprises at least two groups of reaction wells and wherein each group of reaction wells is fluidically isolated from the other group of reaction wells during the second reaction stage of operation.

Claim 3 (original): The parallel batch reactor of claim 2 wherein said groups of reaction wells are fluidically isolated from each other by a flow restriction device.

Claim 4 (original): The parallel batch reactor of claim 2 wherein said groups of reaction wells are fluidically isolated from each other by one or more check valves.

Claim 5 (original): The parallel batch reactor of claim 2 wherein each of said groups of reaction wells are in fluid communication with an inlet check valve positioned between the pressure chamber and said group of reaction wells and operable to allow flow into the reaction wells from the pressure chamber and restrict flow from the reaction wells into the pressure chamber.

Claim 6 (original): The parallel batch reactor of claim 2 further comprising a cover operable to isolate each of the groups of reaction wells during the second stage of operation.

Claim 7 (original): The parallel batch reactor of claim 2 wherein said plurality of reaction wells are arranged in an array.

Claim 8 (original): A parallel batch reactor for effecting chemical reactions, the parallel batch reactor comprising:

a pressure chamber;

a base having a plurality of reaction wells, each of said reaction wells having a closed lower end and an open upper end for receiving components for the reaction;

a cover configured for sealing engagement with the base to form a housing enclosing said plurality of reaction wells;

an inlet port in fluid communication with the pressure chamber for pressurizing the pressure chamber from an external source; and

a flow restriction device comprising a plurality of check valves each configured to allow flow from the pressure chamber into one or more of said plurality of reaction wells and restrict flow from the one or more reaction wells into the pressure chamber.

Claim 9 (original): The parallel batch reactor of claim 8 wherein said plurality of reaction wells comprises at least two groups of reactions wells and the flow restriction device is operable to fluidically isolate the groups of reactions wells from one another.

Claim 10 (original): The parallel batch reactor of claim 9 wherein said plurality of check valves comprises inlet check valves positioned between the pressure chamber and each of said group of reaction wells.

Claim 11 (original): The parallel batch reactor of claim 8 wherein said plurality of check valves are contained within the cover.

Claim 12 (original): The parallel batch reactor of claim 8 wherein material and structure of the pressure chamber is such that the chamber is operable to sustain an operating pressure above 40 psig.

Claim 13 (original): The parallel batch reactor of claim 8 wherein the flow restriction device further comprises a plurality of outlet check valves, each of said plurality of outlet check valves positioned between one or more of said plurality of reaction wells and an outlet port.

Claim 14 (original): A parallel batch reactor for effecting chemical reactions, the parallel batch reactor comprising:

a pressure chamber;

an inlet port in fluid communication with the pressure chamber for pressurizing the pressure chamber from an external pressure source; and

at least two groups of reaction vessels, each of said groups comprising a plurality of reaction vessels and each of said groups of reaction vessels being in isolatable fluid communication with the pressure chamber such that during a first pressurizing stage of operation, each of said groups of reaction vessels are configured for pressurization through fluid communication with the pressure chamber, and during a second reaction stage of operation, said at least two groups of reaction vessels are isolated from one another.

Claim 15 (original): The parallel batch reactor of claim 14 wherein the pressure chamber comprises a cover configured for sealing engagement with a base, and said at least two groups of reaction vessels are an array of reaction vessels formed in or supported by a common substrate, the base being adapted for receiving the array of reaction vessels.

Claim 16 (original): The parallel batch reactor of claim 14 wherein said at least two groups of reaction vessels are configured for pressurization through the pressure chamber to a pressure ranging from approximately 10 psig to approximately 1500 psig.

Claim 17 (original): The parallel batch reactor of claim 14 further comprising at least two outlet check valves, including at least one outlet check valve associated with each of at least two groups of reaction vessels, the outlet check valves isolating its

associated group of reaction vessels from one another during the second reaction stage of operation.

Claim 18 (original): The parallel batch reactor of claim 14 wherein material and structure of the pressure chamber is such that the chamber is operable to sustain an operating pressure above 40 psig.
